To:

Chan, Christina

Subject:

Christina, please authorize rush search of 3 short popeptides of SEQ ID NO:2, 3, and 9 in application 09/774,954. Please also against DNA data bases. Thank you.

Malgorzata

Malgorzata A. Walicka, Ph.D. Patent Examiner Art Unit 1652, Recombinant Enzymes USPTO, Remsen Building, Room 2C76 400 Dulany St. Alexandria, VA 22313 Mail Room 2C70 Tel. (571) 272-0944, fax (571) 273-0944

                                                                                                                                                                               Glycobiology 13:IC-5C(2003).

-1- FUNCTION: Catalyzes the reaction that attaches fucose through an O-glycosidic linkage to a conserved serine or threonine residue in EGP domains (By similarity).

-1- CATALYTIC ACTIVITY: Transfers an alpha-L-fucosyl residue from GDP-beta-L-fucose to the serine hydroxy group of a protein acceptor.
-1- COFACTOR: Manganese (By similarity).
-1- PATHWAY: Glycosylation.
-1- SIMILARITY: Belongs to the glycosyltransferase 68 family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          1 MPAGSWDPAGYLLYCPCMGRFGNQADHFLGSLAFAKLLNRTLAVPPWIEYQHHKPPFTNL

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    90
               -!- FUNCTION: Catalyzes the reaction that attaches fucose through an O-glycosidic linkage to a conserved serine or threonine residue in BGF domains (By similarity).
-!- CATALYTIC ACTIVITY: Transfers an alpha-L-fucosyl residue from GDP-beta-L-fucose to the serine hydroxy group of a protein acceptor.
-!- COFACTOR: Manganese (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            31 AGSWDLAGYLLYCPCMGRFGNQADHFLGSLAFAKLLNRTLAVPPWIEYQHHKPPFTNLHV

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Nagase, T., Seki, N., Ishikawa, K., Tanaka, A. and Nomura, N.

Prediction of the coding sequences of unidentified human genes. V.

The coding sequences of 40 new genes (KIRA0161-KIRA0200) deduced by analysis of cDNA clones from human cell line KG-1

DNA Res. 3 (1), 17-24 (1996)

TITLE OF INVENTION: DETECTION KIT, SUCH AS NUCLEIC ACID
TITLE OF INVENTION: ARRAYS, FOR DETECTING EXPRESSION OF 10,000 OR MORE
TITLE OF INVENTION: DROSOPHILA GENES.
FILE REPERRACE: CLOOD728
CURRENT APPLICATION NUMBER: US/11/097,143
CURRENT FILING DATE: 1999-10-05
PRIOR APPLICATION NUMBER: 60/157,832
PRIOR APPLICATION NUMBER: 60/161,931
PRIOR PELING DATE: 1999-10-05

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        LeupheThrGlyIleSerPheSerAlaSerTyrArgGluGlnTrpSerGlnArgPheSer 160
                                                                                                                                                                                                                                                                                                   This DNA encodes a human heart O-fucosyltransferase that can glycosylate an epidermal growth factor (EFF) domain of a polypeptide with an activated O-fucose residue. Inhibitors of O-fucosyltransferase, activated O-fucose falinity for the EFG domains, are used in diagnosis and treatment of conditions associated with overexpression of C-fucosyltransferase, to promete survival of sensory (retinal) neurons. Probes based on EFF domain polypeptide are used to detect gene amplification and expression. The expression can also be determined at the protein level using antibodies specific for O-fucosyltransferase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          PheGlyAenGlnAlaAspHisPheLeuGlySerLeuAlaPheAlaLysLeuLeuAsnArg 40

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ò
                                                                                                                                                                                                                                                                                       The invention relates to human tumour-associated antigenic target (TAT) polypeptides, and their related nucleic acids. The TAT polypeptides are overexpressed in cancer tissues compared to normal tissues, and may thus serve as effective targets for the diagnosis and treatment of cancer in mammals. The invention also relates to nucleic acid and polypeptide polypeptides at least 80% identical to the TAT nucleic acids and polypeptide and polypeptides and methods and compositions for the treatment or TAT polypeptide; and methods and compositions for the treatment or TAT polypeptides, mutabody specific for a TAT polypeptide, nucleic acids, antibodies, antagonists, binding molecules and compositions are useful for diagnosing or treating a cell proliferative disorder associated with concert, pancreatic cancer, colorectal cancer, lung cancer, cancers such as breast cancer, colorectal cancer, lung cancer, carvical cancer, cancers of the central cancer, pancreatic cancer, cervical cancer, cancers of the central cancer, nucleic acids may further be used as hybridisation probes, in chromosome and gene mapphing, in chromosome identification and in gene therapy. The present sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention relates to a method (M1) for determining the subtype of leukaemia cells and whether a patient sample contains leukaemia cells. The method comprises determining the expression profile of a group of markers in a patient sample. The method is useful for determining the presence of leukaemia cells, its types or subtypes, and for the preparation of a medicament for treating leukaemia.
                                                                   Determining the subtype of leukemia cells and whether a patient sample contains leukemia cells or other cells, useful for treating leukemia, comprises determining the expression profile of a group of markers in a patient sample.

                                                                                                                                                                                                                                                                                                                                                                                                                               4415
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This represents the nucleotide sequence of the plasmid construct used for the expression of human heart O-fucosyltransferase. The human O-fucosyltransferase can glycosylate an epidermal growth factor (BGF) domain of a polypeptide with an activated O-fucose residue. Inhibitors of O-fucosyltransferase, e.g. mutants with increased affinity for the EFG domains, are used in diagnosis and treatment of conditions associated with overexpression of O-fucosyltransferase, to promote survival of sensory (retinal) neurons. Probes based on EGF domain polypeptide are used to detect gene amplification and expression. The expression can also be determined at the protein level using antibodies specific for O-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     140

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to polymucleotides (AAK51456-AAK53435) and the encoded polypeptides (AAM78323-AAM80302) that exhibit activity elating to production of other cytokines in other cell populations. The production of other cytokines in other cell populations. The polymucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides are useful in gene therapy, vaccines or city stem cell growth factor activity, haematopolesis regulating activity, tissue growth factor activity, haematopolesis regulating activity, tissue growth factor activity, immunomodulatory activity and activity tissue growth factor activity, immunomodulatory activity and activity tissue growth factor activity, immunomodulatory activity and inflammation. Note: Records for SEQ ID NO 2100 (AAK52581), 2111 inflammation. Note: Records for SEQ ID NO 2100 (AAK52581), 2111 from the sequence listing were missing at the time of publication
